

Bingo Blender File Delivery Guide

Included Files

This delivery contains the following Blender files:

Animation scenes

- [Bingo_Timid.blend](#)
- [Bingo_Eccentric.blend](#)
- [Bingo_DeadPan.blend](#)
- [Bingo_Cheeky.blend](#)
- [Bingo_Laidback.blend](#)
- [Bingo_Enthusiastic.blend](#)

Each animation file contains its respective finished character animation.

Rig source

- [BingoRig_Latest.blend](#)

This is the source rig referenced by all animation scenes. The rig is **linked** into the animation files rather than duplicated inside each file.

Master scene

- [Bingo_MasterScene_01.blend](#)

This is a clean starting scene containing the linked Bingo rig without one of the delivered personality animations applied.

Important: Keep the Files Together

The animation scenes use Blender's linked-library system. This means that each animation file depends on:

BingoRig_Latest.blend

To prevent the link from breaking:

1. Download the **entire delivery folder**, not only an individual animation file.
2. Keep all **.blend** files together in the same folder.
3. Do not rename **BingoRig_Latest.blend**.
4. Do not move the rig file into a different folder unless you plan to relink it.
5. Open the files from a local folder on your computer rather than directly inside a ZIP file or browser preview.

A recommended folder structure is:

```
Bingo_Blender_Files/  
├── BingoRig_Latest.blend  
├── Bingo_MasterScene_01.blend  
├── Bingo_Cheeky.blend  
├── Bingo_DeadPan.blend  
├── Bingo_Eccentric.blend  
├── Bingo_Enthusiastic.blend  
├── Bingo_Laidback.blend  
└── Bingo_Timid.blend
```

Opening an Animation

1. Download and extract the complete delivery folder.
2. Confirm that **BingoRig_Latest.blend** is in the same folder as the animation files.
3. Launch Blender.
4. Select **File** → **Open**.
5. Open the animation you would like to view, such as:

Bingo_Cheeky.blend

6. Allow the scene to finish loading before interacting with the rig.
7. Press the **Spacebar** or use the Timeline playback controls to preview the animation.

Each animation file is a separate scene, so open the file corresponding to the performance you need.

Using the Master Scene

Open:

Bingo_MasterScene_01.blend

when you need a clean scene with the Bingo rig already linked and ready for additional work.

Because the character is linked from [BingoRig_Latest.blend](#), the master scene may use a **Library Override** or another editable control setup for animation. Animate the provided control rig rather than attempting to edit the linked source geometry directly.

How the Linked Rig Works

The source character, rig, and related assets are stored in:

BingoRig_Latest.blend

The animation scenes reference this source file. This system provides several benefits:

- Every scene uses the same character and rig.
- The character does not need to be duplicated across every file.
- Rig updates can be managed from a central source file.
- File sizes remain smaller and more organized.

However, the linked rig must remain accessible at the file path Blender expects. Moving, deleting, or renaming the source rig can cause the character to appear missing when an animation file is opened.

Relinking the Rig if It Is Missing

A broken link may result in missing character geometry, empty collections, warning messages, or pink/missing assets.

Automatic relinking

1. Open the affected animation file.
2. Go to:

File → External Data → Find Missing Files

3. Browse to the folder containing:

BingoRig_Latest.blend

4. Select the delivery folder and click **Find Missing Files**.
5. Blender should locate and reconnect the missing linked library.
6. Save the animation file after confirming that the character has returned.

Using the folder containing the rig is generally sufficient; you do not need to select objects from inside the rig file.

Check which files are missing

To have Blender identify missing external references, go to:

File → External Data → Report Missing Files

Review the warning message shown by Blender. It should indicate whether **BingoRig_Latest.blend** or another external asset cannot be found.

Manual library relocation

Should **Find Missing Files** not resolve the issue:

1. Switch one Outliner area to the **Blender File** display mode.
2. Expand the **Libraries** section.
3. Locate the missing entry for **BingoRig_Latest.blend**.
4. Right-click the library entry.
5. Choose **Relocate** or **Find Missing File**, depending on the Blender version.
6. Browse to the delivered copy of **BingoRig_Latest.blend**.

7. Confirm the new location.
8. Save the corrected animation scene.

Menu wording can vary slightly between Blender versions.

Saving the Repaired File

After relinking:

1. Confirm that the character, rig controls, and animation are visible.
2. Scrub through the Timeline to ensure the animation is working.
3. Use **File** → **Save As**.
4. Save the repaired file inside the same delivery folder.

It is recommended to save a new copy while troubleshooting, for example:

Bingo_Cheeky_Relinked.blend

This preserves the originally delivered file.

Updating the Source Rig

Because the animation files reference `BingoRig_Latest.blend`, changes made to the source rig may appear in every linked scene that uses it.

Before editing or replacing the source rig:

- Create a backup.
- Keep the filename unchanged.
- Avoid renaming linked collections, armatures, bones, or objects.
- Do not delete objects used by existing animation scenes.
- Test the updated rig in a duplicate of one animation file first.

Replacing the rig with a structurally different version may break Library Overrides, constraints, drivers, animation controls, or object references.

Troubleshooting Checklist

When a character or rig does not load, confirm that:

- The delivery was fully downloaded and extracted.
- All `.blend` files are in the same folder.
- `BingoRig_Latest.blend` has not been renamed.
- The animation file is not being opened from inside a ZIP archive.
- The files are available locally and are not still downloading from cloud storage.
- Blender has permission to access the folder.
- **File** → **External Data** → **Find Missing Files** has been run.
- The same or a compatible Blender version is being used.

If the scene opens correctly but the controls cannot be edited, confirm that you are selecting the provided animation controls or Library Override rather than the original linked rig data.
